Appendix G . . . . .	Index for Source Code

## Appendix A — Java Quick Reference

Accessible Methods from the Java Library That May Be Included on the Exam

```

class java.lang.Object
• boolean equals(Object other)
• String toString()

class java.lang.Integer
• Integer(int value)
• int intValue()
• Integer.MIN_VALUE // minimum value represented by an int or Integer
• Integer.MAX_VALUE // maximum value represented by an int or Integer

class java.lang.Double
• Double(double value)
• double doubleValue()

class java.lang.String
• int length()
• String substring(int from, int to) // returns the substring beginning at from
// and ending at to-1
• String substring(int from) // returns substring(from, length())
• int indexOf(String str) // returns the index of the first occurrence of str;
// returns -1 if not found
• int compareTo(String other) // returns a value < 0 if this is less than other
// returns a value = 0 if this is equal to other
// returns a value > 0 if this is greater than other

class java.lang.Math
• static int abs(int x)
• static double abs(double x)
• static double pow(double base, double exponent)
• static double sqrt(double x)
• static double random() // returns a double in the range [0.0, 1.0)

interface java.util.List<E>
• int size()
• boolean add(E obj) // appends obj to end of list; returns true
• void add(int index, E obj) // inserts obj at position index (0 ≤ index ≤ size),
// moving elements at position index and higher
// to the right (adds 1 to their indices) and adjusts size

• E get(int index)
• E set(int index, E obj) // replaces the element at position index with obj
// returns the element formerly at the specified position

• E remove(int index) // removes element from position index, moving elements
// at position index + 1 and higher to the left
// (subtracts 1 from their indices) and adjusts size
// returns the element formerly at the specified position

class java.util.ArrayList<E> implements java.util.List<E>

```

## Class Summary and Index

<b>Class*</b> ----- <b>Package</b>	<b>Description</b>	<b>Page</b>	<b>Tested in AP CS Exam?</b>
<b>AbstractGrid</b> ----- info.gridworld.grid	AbstractGrid contains the methods that are common to grid implementations.	D - 1, D - 2	Implementation (AB only)
<b>Actor</b> ----- info.gridworld.actor	An Actor is an entity that can act. It has a color and direction.	B - 3	API only
ActorWorld ----- info.gridworld.actor	An ActorWorld is occupied by actors.	Student Manual Part 3	Not tested
<b>BoundedGrid</b> ----- info.gridworld.grid	A BoundedGrid is a rectangular grid with a finite number of rows and columns.	D - 3, D - 4	Implementation (AB only)
<b>BoxBug</b> ----- (none)	A BoxBug traces out a square “box” of a given size.	C - 3	Implementation
BoxBugRunner ----- (none)	This class runs a world that contains box bugs.	Student Manual Part 2	Not tested
<b>Bug</b> ----- info.gridworld.actor	A Bug is an actor that can move and turn. It drops flowers as it moves.	C - 1, C - 2	Implementation
BugRunner ----- (none)	This class runs a world that contains a bug and a rock, added at random locations.	In the projects/ firstProject folder of the code distribution	Not tested
<b>ChameleonCritter</b> ----- (none)	A ChameleonCritter takes on the color of neighboring actors as it moves through the grid.	C - 6	Implementation
ChameleonRunner ----- (none)	This class runs a world that contains chameleon critters.	In the projects/ critters folder of the code distribution	Not tested

\***Bold formatting** of a class name indicates that students are responsible for the use of that class on the AP Computer Science Exams at the level indicated in this chart.

<b>Class*</b> ----- <b>Package</b>	Description	Page	Tested in AP CS Exam?
CrabCritic ----- (none)	A CrabCritic looks at a limited set of neighbors when it eats and moves.	Student Manual Part 4	Not tested
CrabRunner ----- (none)	This class runs a world that contains crab critters.	In the projects/ critters folder of the code distribution	Not tested
<b>Critter</b> ----- info.gridworld.actor	A Critter is an actor that moves through its world, processing other actors in some way and then picking a new location.	C - 4, C - 5, C - 6	Implementation
CritterRunner ----- (none)	This class runs a world that contains critters.	In the projects/ critters folder of the code distribution	Not tested
<b>Flower</b> ----- info.gridworld.actor	A Flower is an actor that darkens over time. Some actors drop flowers as they move.	B - 4	API only
<b>Grid</b> ----- info.gridworld.grid	Grid provides an interface for a two-dimensional, grid-like environment containing arbitrary objects.	B - 2	API only
<b>Location</b> ----- info.gridworld.grid	A Location object represents the row and column of a location in a two-dimensional grid.	B - 1	API only
<b>Rock</b> ----- info.gridworld.actor	A Rock is an actor that does nothing. It is commonly used to block other actors from moving.	B - 4	API only
<b>UnboundedGrid</b> ----- info.gridworld.grid	An UnboundedGrid is a rectangular grid with an unbounded number of rows and columns.	D - 5, D - 6	Implementation (AB only)
World ----- info.gridworld.world	A World is the mediator between a grid and the GridWorld GUI.	In the API documentation of the code distribution	Not tested

\***Bold formatting** of a class name indicates that students are responsible for the use of that class on the AP Computer Science Exams at the level indicated in this chart.

## Appendix B — Testable API

### `info.gridworld.grid.Location` class (implements `Comparable`)

```
public Location(int r, int c)
    constructs a location with given row and column coordinates

public int getRow()
    returns the row of this location

public int getCol()
    returns the column of this location

public Location getAdjacentLocation(int direction)
    returns the adjacent location in the direction that is closest to direction

public int getDirectionToward(Location target)
    returns the closest compass direction from this location toward target

public boolean equals(Object other)
    returns true if other is a Location with the same row and column as this location; false otherwise

public int hashCode()
    returns a hash code for this location

public int compareTo(Object other)
    returns a negative integer if this location is less than other, zero if the two locations are equal, or a positive
    integer if this location is greater than other. Locations are ordered in row-major order.
    Precondition: other is a Location object.

public String toString()
    returns a string with the row and column of this location, in the format (row, col)
```

Compass directions:

```
public static final int NORTH = 0;
public static final int EAST = 90;
public static final int SOUTH = 180;
public static final int WEST = 270;
public static final int NORTHEAST = 45;
public static final int SOUTHEAST = 135;
public static final int SOUTHWEST = 225;
public static final int NORTHWEST = 315;
```

Turn angles:

```
public static final int LEFT = -90;
public static final int RIGHT = 90;
public static final int HALF_LEFT = -45;
public static final int HALF_RIGHT = 45;
public static final int FULL_CIRCLE = 360;
public static final int HALF_CIRCLE = 180;
public static final int AHEAD = 0;
```

**info.gridworld.grid.Grid<E> interface**

`int getNumRows()`  
returns the number of rows, or -1 if this grid is unbounded

`int getNumCols()`  
returns the number of columns, or -1 if this grid is unbounded

`boolean isValid(Location loc)`  
returns true if loc is valid in this grid, false otherwise  
**Precondition:** loc is not null

`E put(Location loc, E obj)`  
puts obj at location loc in this grid and returns the object previously at that location (or null if the location was previously unoccupied).  
**Precondition:** (1) loc is valid in this grid (2) obj is not null

`E remove(Location loc)`  
removes the object at location loc from this grid and returns the object that was removed (or null if the location was unoccupied)  
**Precondition:** loc is valid in this grid

`E get(Location loc)`  
returns the object at location loc (or null if the location is unoccupied)  
**Precondition:** loc is valid in this grid

`ArrayList<Location> getOccupiedLocations()`  
returns an array list of all occupied locations in this grid

`ArrayList<Location> getValidAdjacentLocations(Location loc)`  
returns an array list of the valid locations adjacent to loc in this grid  
**Precondition:** loc is valid in this grid

`ArrayList<Location> getEmptyAdjacentLocations(Location loc)`  
returns an array list of the valid empty locations adjacent to loc in this grid  
**Precondition:** loc is valid in this grid

`ArrayList<Location> getOccupiedAdjacentLocations(Location loc)`  
returns an array list of the valid occupied locations adjacent to loc in this grid  
**Precondition:** loc is valid in this grid

`ArrayList<E> getNeighbors(Location loc)`  
returns an array list of the objects in the occupied locations adjacent to loc in this grid  
**Precondition:** loc is valid in this grid

**info.gridworld.actor.Actor class**

```

public Actor()
    constructs a blue actor that is facing north

public Color getColor()
    returns the color of this actor

public void setColor(Color newColor)
    sets the color of this actor to newColor

public int getDirection()
    returns the direction of this actor, an angle between 0 and 359 degrees

public void setDirection(int newDirection)
    sets the direction of this actor to the angle between 0 and 359 degrees that is equivalent to newDirection

public Grid<Actor> getGrid()
    returns the grid of this actor, or null if this actor is not contained in a grid

public Location getLocation()
    returns the location of this actor, or null if this actor is not contained in a grid

public void putSelfInGrid(Grid<Actor> gr, Location loc)
    puts this actor into location loc of grid gr. If there is another actor at loc, it is removed.
    Precondition: (1) This actor is not contained in a grid. (2) loc is valid in gr.

public void removeSelfFromGrid()
    removes this actor from its grid
    Precondition: this actor is contained in a grid

public void moveTo(Location newLocation)
    moves this actor to newLocation. If there is another actor at newLocation, it is removed.
    Precondition: (1) This actor is contained in a grid. (2) newLocation is valid in the grid of this actor.

public void act()
    reverses the direction of this actor. Override this method in subclasses of Actor to define types of actors with
    different behavior.

public String toString()
    returns a string with the location, direction, and color of this actor

```

**info.gridworld.actor.Rock class (extends Actor)**

```
public Rock()  
    constructs a black rock  
  
public Rock(Color rockColor)  
    constructs a rock with color rockColor  
  
public void act()  
    overrides the act method in the Actor class to do nothing
```

**info.gridworld.actor.Flower class (extends Actor)**

```
public Flower()  
    constructs a pink flower  
  
public Flower(Color initialColor)  
    constructs a flower with color initialColor  
  
public void act()  
    causes the color of this flower to darken
```

## Appendix C — Testable Code

### Bug.java

```
package info.gridworld.actor;

import info.gridworld.grid.Grid;
import info.gridworld.grid.Location;

import java.awt.Color;

/**
 * A Bug is an actor that can move and turn. It drops flowers as it moves.
 * The implementation of this class is testable on the AP CS A and AB Exams.
 */
public class Bug extends Actor
{
    /**
     * Constructs a red bug.
     */
    public Bug()
    {
        setColor(Color.RED);
    }

    /**
     * Constructs a bug of a given color.
     * @param bugColor the color for this bug
     */
    public Bug(Color bugColor)
    {
        setColor(bugColor);
    }

    /**
     * Moves if it can move, turns otherwise.
     */
    public void act()
    {
        if (canMove())
            move();
        else
            turn();
    }

    /**
     * Turns the bug 45 degrees to the right without changing its location.
     */
    public void turn()
    {
        setDirection(getDirection() + Location.HALF_RIGHT);
    }
}
```

```
/**
 * Moves the bug forward, putting a flower into the location it previously occupied.
 */
public void move()
{
    Grid<Actor> gr = getGrid();
    if (gr == null)
        return;
    Location loc = getLocation();
    Location next = loc.getAdjacentLocation(getDirection());
    if (gr.isValid(next))
        moveTo(next);
    else
        removeSelfFromGrid();
    Flower flower = new Flower(getColor());
    flower.putSelfInGrid(gr, loc);
}

/**
 * Tests whether this bug can move forward into a location that is empty or contains a flower.
 * @return true if this bug can move.
 */
public boolean canMove()
{
    Grid<Actor> gr = getGrid();
    if (gr == null)
        return false;
    Location loc = getLocation();
    Location next = loc.getAdjacentLocation(getDirection());
    if (!gr.isValid(next))
        return false;
    Actor neighbor = gr.get(next);
    return (neighbor == null) || (neighbor instanceof Flower);
    // ok to move into empty location or onto flower
    // not ok to move onto any other actor
}
}
```

**BoxBug.java**

```

import info.gridworld.actor.Bug;

/**
 * A BoxBug traces out a square "box" of a given size.
 * The implementation of this class is testable on the AP CS A and AB Exams.
 */
public class BoxBug extends Bug
{
    private int steps;
    private int sideLength;

    /**
     * Constructs a box bug that traces a square of a given side length.
     * @param length the side length
     */
    public BoxBug(int length)
    {
        steps = 0;
        sideLength = length;
    }

    /**
     * Moves to the next location of the square.
     */
    public void act()
    {
        if (steps < sideLength && canMove())
        {
            move();
            steps++;
        }
        else
        {
            turn();
            turn();
            steps = 0;
        }
    }
}

```

## Criticter.java

```

package info.gridworld.actor;

import info.gridworld.grid.Location;
import java.util.ArrayList;

/**
 * A Critter is an actor that moves through its world, processing
 * other actors in some way and then moving to a new location.
 * Define your own critters by extending this class and overriding any methods of this class except for act.
 * When you override these methods, be sure to preserve the postconditions.
 * The implementation of this class is testable on the AP CS A and AB Exams.
 */
public class Critter extends Actor
{
    /**
     * A critter acts by getting a list of other actors, processing that list, getting locations to move to,
     * selecting one of them, and moving to the selected location.
     */

     * Turns towards the new location as it moves.
     */
    public void makeMove(Location loc)
    {
        setDirection(getLocation().getDirectionToward(loc));
        super.makeMove(loc);
    }
}

```

## Appendix E — GridWorld Quick Reference

### Location Class (implements Comparable)

```
public Location(int r, int c)
public int getRow()
public int getCol()
public Location getAdjacentLocation(int direction)
public int getDirectionToward(Location target)
public boolean equals(Object other)
public int hashCode()
public int compareTo(Object other)
public String toString()
```

NORTH, EAST, SOUTH, WEST, NORTHEAST, SOUTHEAST, NORTHWEST, SOUTHWEST  
LEFT, RIGHT, HALF\_LEFT, HALF\_RIGHT, FULL\_CIRCLE, HALF\_CIRCLE, AHEAD

### Grid<E> Interface

```
int getNumRows()
int getNumCols()
boolean isValid(Location loc)
E put(Location loc, E obj)
E remove(Location loc)
E get(Location loc)
ArrayList<Location> getOccupiedLocations()
ArrayList<Location> getValidAdjacentLocations(Location loc)
ArrayList<Location> getEmptyAdjacentLocations(Location loc)
ArrayList<Location> getOccupiedAdjacentLocations(Location loc)
ArrayList<E> getNeighbors(Location loc)
```

### Actor Class

```
public Actor()
public Color getColor()
public void setColor(Color newColor)
public int getDirection()
public void setDirection(int newDirection)
public Grid<Actor> getGrid()
public Location getLocation()
public void putSelfInGrid(Grid<Actor> gr, Location loc)
public void removeSelfFromGrid()
public void moveTo(Location newLocation)
public void act()
public String toString()
```

Rock Class (extends Actor)

```
public Rock()  
public Rock(Color rockColor)  
public void act()
```

Flower Class (extends Actor)

```
public Flower()  
public Flower(Color initialColor)  
public void act()
```

Bug Class (extends Actor)

```
public Bug()  
public Bug(Color bugColor)  
public void act()  
public void turn()  
public void move()  
public boolean canMove()
```

BoxBug Class (extends Bug)

```
public BoxBug(int n)  
public void act()
```

Critter Class (extends Actor)

```
public void act()  
public ArrayList<Actor> getActors()  
public void processActors(ArrayList<Actor> actors)  
public ArrayList<Location> getMoveLocations()  
public Location selectMoveLocation(ArrayList<Location> locs)  
public void makeMove(Location loc)
```

ChameleonCritter Class (extends Critter)

```
public void processActors(ArrayList<Actor> actors)  
public void makeMove(Location loc)
```
